▼ Suche jmd. der sich mit Python auskennt (85)

Für meine Masterarbeit suche ich jemanden, der sich mit Python insb. mit Numpy, Pandas und Matplotlib auskennt. Es geht dabei mir allem um die Datenaufbereitung und -visualisierung. Ich bräuchte vlt so 3h Hilfe, könnte aber auch mehr oder weniger sein.

Bei Interesse schickt bitte eine Mail mit eurer Gehaltsvorstellung an

Besten Danke im Voraus!

for python

for-loops in python operate on so-called iterables, this makes them very versatile
Python provides a lot of iterables. For now we will focus on lists, ranges and strings

for python

```
1 >>> for elem in range(4):
2 >>>     print(elem)
3 0
4 1
5 2
6 3
```

Ranges start at 0 and do not include the end

for python

```
1 >>> fruits= ['apples', 'bananas', 'strawberries']
2 >>> for fruit in fruits:
3 >>>     print(fruit)
4 apples
5 bananas
6 strawberries
```

for can also iterate over the elements of a list

for python

```
1 >>> for letter in 'café':
2 >>>     print(letter)
3 c
4 a
5 f
6 é
```

Strings in python 3 can handle special unicode characters
Strings are also iterables

notepad.exe

Open a text editor and save the content of the next slide in a file called `count.py`
Make sure that the editor does not add a filename-extension like `.txt`

7/14

count.py

```
1 #!/usr/bin/env python3
2
3 for i in range(10):
4     print(i)
```

8/14

cmd.exe

```
#!/usr/bin/env python3
for i in range(10):
    print(i)
```

Open a terminal window and use `cd` to navigate to the directory where you stored `count.py`
Type `python count.py` (on Windows) / `python3 count.py` (on Linux) and hit `enter` to execute `count.py`
Hint: Use the `Tab` key to automatically complete directory/file/program names

9/14

Division 10

Edit `count.py` so that it outputs the numbers from 0.0 to 0.9 in steps of 0.1.

```
0.0
0.1
0.2
0.3
0.4
--
```

10/14

for for

Edit `count.py` so that its output looks like [this](#) example

```
x y
0.0 0.4
0.0 0.5
0.0 0.6
0.0 0.7
0.0 0.8
0.0 0.9
0.1 0.0
0.1 0.1
```

11/14

thagoras.py

Python has an exponentiation operator `b**e`

A square root is an exponentiation by $\frac{1}{2}$

Thus, in python, the distance `d` between two points in a cartesian coordinate system can be calculated as `d= (x**2 + y**2)**0.5`

12/14

pi.py

Add a variable `inside=0` to `count.py` that is incremented by one whenever $(x^2 + y^2)$ is smaller than 1
At the end of the program `print(inside*4/100)`

13/14

pi.py

Decrease the step size from 0.1 to 0.001
At the end of the program `print(inside*4/(1000**2))`
Try to recognize the number and find out why it is the result of the calculation

14/14
